WHAT IS HACKEN?

Hacken is a decentralized custom-tailored platform that provides the entire scope of cybersecurity services. The services can be provided both by the global community of white hat hackers, as well as by Hacken’s in-house cybersecurity specialists. Hacken’s mission is to improve the overall cybersecurity standards around the globe. With this in mind, the company represents a wide range of products in order to effectively meet customer demand.

HackenProof - Tokenized crowdsourced vulnerability rewarding platform.
The core of the HackenProof platform is the ethical cooperation between cybersecurity professionals and IT companies that care about security. We ensure responsible and coordinated vulnerability disclosure in order to encourage white hat hackers to protect modern businesses. The tokenized platform means it’s decentralized among the community. Having remuneration in HKNs, bug hunters are the main stakeholders of the platform. HKN’s price directly depends on the quality of the provided services, number of secured clients and overall size of the white hat community.
Members of the Hacken Community are actively bringing the best hackers and attracting new clients to the platform.

Smart Contract Audit
This direction includes both objective findings from the contract code, as well as subjective assessments of the overall architecture and design choices by consulting experts. This audit will evaluate whether the code has been written in a way that ensures readability and maintainability. Also, it will assess if the codebase follows the modern best and established practices for SC development. The main advantage of Smart Contract Audit by Hacken is crowdsourced approach.

Anti-Phishing
Fast and effective identification of phishing content contained on websites, emails, social networks or other forms used for accessing data. Active anti-phishing by Hacken means websites takedown in 12 hrs, takedown of fraudulent Google Ads and other search ads, deleting fake social media accounts using your brand. In turn, Hacken provides a passive anti-phishing, which comprises constant phishing domain detecting, as well as permanent Google Ads and Search Ads monitoring, social media activity.

HKN TOKEN

The Hacken Ecosystem is a tokenized environment where all payments and transactions are conducted via the cybersecurity utility token - HKN. It ensures that the ecosystem is decentralized among the community. For example, having remuneration in HKNs, bug hunters operating on HackenProof are the main stakeholders of the platform. HKN’s price directly depends on the quality of the provided services, number of secured clients and overall size of the white hat community. The same deal applies with Smart contracts auditors, vendors distributing products and services via Hacken Marketplace etc.
